#### RESULT 1 ABP60362 Streptavidin; protein chip; microtitre plate; detection. Streptavidin binding peptide 21-MAR-2001; 2001DE-01013776 02-OCT-2002. Misc-difference Synthetic 28-MAR-2003 ABP60362; ABP60362 standard; peptide; 21-MAR-2001; 2001DE-01013776. DE10113776-A1 (BIOA-) INST BIOANALYTIK GMBH GOETTINGEN. (first entry) Location/Qualifiers /label= unknown 24 SEQ ID ₿ ğ

The invention relates to an isolated peptide (I) comprising at least two individual modules separated by 0-50 amino acids, with each containing at least one motif His-Pro-X where X = Gln, Asn or Met. (I), which contain streptavidin binding modules, are useful as affinity handles for purification of recombinant fusion proteins (FP), also for detecting FP, e.g. on protein chips or microtitre plates. The modules in (I) bind stronger binding than a single tag, but are displaced by a competitor. (I) does not interfere with the function of attached proteins (II) (so it may not be essential to remove it); facilitates detection and has easily

eins (II) (so it and has easily

New isolated peptide, useful as affinity purification tag for recombinant protein, comprises at least two high-affinity streptavidin-binding modules.

                           The invention relates to an isolated peptide (I) comprising at least two individual modules separated by 0-50 amino acids, with each containing at least one motif His-Pro-X where X = Gln, Asn or Met. (I), which contain streptavidin binding modules, are useful as affinity handles for purification of recombinant fusion protein s (FP), also for detecting FP, e.g. on protein chips or microtitre plates. The modules in (I) bind strongly to streptavidin, with a co-operative effect that provides stronger binding than a single tag, but are displaced by a competitor. (I) does not interfere with the function of attached proteins (II) (so it may not be essential to remove it); facilitates detection and has easily controllable binding properties. (I) is particularly used for purifying FP from dilute solution in batch formats (which use simpler apparatus than column methods and result in lower loss of FP). The present sequence is that of a streptavidin binding peptide disclosed with the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Streptavidin binding peptide SEQ ID NO 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 24
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             controllable binding properties. (I) is particularly used for purifying FP from dilute solution in batch formats (which use simpler apparatus than column methods and result in lower loss of FP). The present sequence is that of a streptavidin binding peptide disclosed with the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 28-MAR-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ABP60369
                                                                                                                                                                                                                                                                                                                               New isolated peptide, useful as affinity purification tag for recombinant protein, comprises at least two high-affinity streptavidin-binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ABP60369 standard; peptide; 35 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Best Local Similarity
                                                                            The invention relates to an isolated peptide (I) comprising at least two individual modules separated by 0-50 amino acids, with each containing at least one motif His-Pro-x where x = Gln, Asn or Met. (I), which containing exceptavidin binding modules, are useful as affinity handles for purification of recombinant fusion protein as [PP], also for detecting FP, e.g. on protein chips or microtitre plates. The modules in (I) bind strongly to streptavidin, with a co-operative effect that provides stronger binding than a single tag, but are displaced by a competitor. (I) does not interfere with the function of attached proteins (II) (so it may not be essential to remove it); facilitates detection and has easily controllable binding properties. (I) is particularly used for purifying FP from dilute solution in batch formats (which use simpler apparatus than column methods and result in lower loss of FP). The present sequence is that of a streptavidin binding peptide disclosed with the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Key

RESULT 4
ADS20243
disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif 4) protein with improved stability compared to a naturally occurring, full-length ADAMTS4 protein, where the modified protein differs from the naturally-occurring, full-length ADAMTS4 protein by at least one amino acid. ADAMTS proteins are a subfamily of zinc metalloproteases and include aggrecanases amongst their members. The protein of the invention demonstrates osteopathic, antinflammatory, antiarthritic, antirheumatic and cytostatic activities and may be useful for treating aggrecanase-associated conditions, including osteoarthritis, glioma, cancer, inflammatory joint disease, rheumatoid arthritis, septic arthritis, periodontal disease and Crohn's disease. The current sequence is that of the human aggrecanase ADAMTS4 mutant E3620 protein with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ADAMTS4; a disintegrin-like and metalloprotease; thrombospondin type 1 motif 4; reprolysin; zinc metalloprotease; aggrecanase; osteopathic; antiinflammatory; antiarthritic; antirheuma cytostatic; osteoarthritis; glioma; cancer; inflammatory joint; rheumatoid arthritis; septic arthritis; periodontal; Crohn's disease;

                    of the lipocalin family by mutation of amino acids in the region of the 4 peptide loops (at one end of the cylindrical 'leaflet' structure). Anticalins can bind to a predetermined ligand with determinable affinity. Anticalins or fusions of anticalins, are used: (a) when immobilized, for separation; and (b) when labeled, for identification of ligands (or their fusions or conjugates). Typically they bind to tissue or tumor-specific surface molecules and can be used for tumour imaging or directly for tumour therapy. Mutations can be introduced into lipocalin polypeptides more easily than into antibodies, since lipocalin polypeptides have only 4 (contrast 6) sequence segments. The peptide loops can tolerate amino acid changes without significant effect on folding. Anticalins have high specific affinity, comparable with that for antibodies. This sequence represents a fusion polypeptide used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Lipocalin; anticalin; peptide loop; leaflet structure; antibody; therapy; tissue-specific surface molecule; tumour-specific surface molecule; tumour imaging; bilin binding protein; DsbC protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
              This invention describes the preparation of anticalins from polypeptides of the lipocalin family by mutation of amino acids in the region of the 4 peptide loops (at one end of the cylindrical 'leaflet' structure).

Chaticalins can bind to a predetermined ligand with determinable affinity. Anticalins or fusions of anticalins, are used: (a) when immobilized, for geparation; and (b) when labeled, for identification of ligands (or their fusions or conjugates). Typically they bind to tissue- or tumor-specific surface molecules and can be used for tumour imaging or directly for tumour therapy. Mutations can be introduced into lipocalin polypeptides more easily than into antibodies, since lipocalin polypeptides have only a (contrast 6) sequence segments. The peptide loops can tolerate amino acid changes without significant effect on folding. Anticalins have high specific affinity, comparable with that for antibodies. This sequence represents a fusion polypeptide used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Lipocalin; anticalin; peptide loop; leaflet structure; antibody; therapy; tissue-specific surface molecule; tumour-specific surface molecule; tumour imaging; protein G; albumin binding domain; bilin binding protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        02-JUL-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAW93969;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Synthetic.

                                                                                                                                                                                                                                                                                        This invention describes novel polypeptides (I) that are muteins of bilin-binding protein (BBP), which can bind digoxigenin (Dig) or its conjugates, do not bind ouabain, testosterone or 4-aminofluorescein, and have an amino acid (aa) substitution at at least one of the positions 28, 31, 34-37, 58, 60, 69, 88. 90, 95. 97, 114, 116, 125 or 127. (I), or its fusion proteins, are used to bind, detect, determine, immobilize or separate Dig or its conjugates with proteins, nucleic acids, carbohydrates, other biological or synthetic macromolecules or low molecular weight compounds, particularly in assays where Dig is being used as a label. Compared with Dig-specific antibodies, (I) have a simpler structure and are easier to prepare. They have very high specificity for Dig, relative to other steroids, and fusion partners may be attached to either end without compromising their ability to bind
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bilin-binding protein; mutein; BBP; digoxigenin.

                                                                                                                                                                                                           of the lipocalin family by mutation of amino acids in the region of the 4 peptide loops (at one end of the cylindrical 'leafler' structure). Anticalins can bind to a predetermined ligand with determinable affinity. Anticalins or fusions of anticalins, are used: (a) when immobilized, for separation; and (b) when labeled, for identification of ligands (or their fusions or conjugates). Typically they bind to tissue or tumor-specific surface molecules and can be used for tumour imaging or directly for tumour therapy. Mutations can be introduced into lipocalin polypeptides more easily than into antibodies, since lipocalin polypeptides have only (contrast 6) sequence segments. The peptide loops can tolerate amino acid changes without significant effect on folding. Anticalins have high specific affinity, comparable with that for antibodies. This sequence represents a fusion polypeptide used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Page 67-69; 80pp; German.

                                                                                                                                                                                                                                                                                     This invention describes novel polypeptides (I) that are muteins of bilin binding protein (BBP), which can bind digoxigenin (Dig) or its conjugates, do not bind ouabain, testosterone or 4-aminofluorescein, and have an amino acid (aa) substitution at at least one of the positions 28, 31, 34-37, 58, 60, 69, 88. 90, 95. 97, 114, 116, 125 or 127. (I), or its fusion proteins, are used to bind, detect, determine, immobilize or separate Dig or its conjugates with proteins, nucleic acids, carbohydrates, other biological or synthetic macromolecules or low molecular weight compounds, particularly in assays where Dig is being used as a label. Compared with Dig-specific annibodies, (I) have a simpler structure and are easier to prepare. They have very high specificity for Dig, relative to other steroids, and fusion partners may be attached to either end without compromising their ability to bind

                                                                                                                                                                                                                                                                                                                                                                                      06-APR-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAB46425;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel polypeptides (I) that are muteins of bilin binding protein (BBP), which can bind digoxigenin (Dig) or its conjugates, do not bind ouabain, testosterone or 4-aminofluorescein, and have an amino acid (aa) substitution at at least one of the positions 28, 31, 34-37, 58, 60, 69, 88. 90, 95. 97, 114, 116, 125 or 127. (I), or its fusion proteins, are used to bind, detect, determine, immobilize or separate Dig or its conjugates with proteins, nucleic acids, carbohydrates, other biological or synthetic macromolecules or low molecular weight compounds, particularly in assays where Dig is being used as a label. Compared with Dig-specific antibodies, (I) have a simpler structure and are easier to prepare. They have very high be attached to either end without compromising their ability to bind lideand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAB46425 standard; protein; 448

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
Best Local
New muteins of bilin-binding protein, useful for detecting digoxigenin being used as label in e.g. binding assays, are very selective for digoxigenin.
                                                                                                                WPI; 2001-071071/08
N-PSDB; AAF25711.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     binding protein (BBP), which can bind digoxigenin (Dig) or its conjugates, do not bind ouabain, testosterone or 4-aminofluorescein, and have an amino acid (aa) substitution at at least one of the positions 28, 31, 34-37, 58, 60, 69, 88. 90, 95, 97, 114, 116, 125 or 127, (1), or its separate Dig or its conjugates with proteins, nucleic acids, carbohydrates, other biological or synthetic macromolecules or low molecular weight compounds, particularly in assays where Dig is being used as a label. Compared with Dig-specific antibodies, (I) have a simpler structure and are easier to prepare. They have very high specificity for Dig, relative to other steroids, and fusion partners may be attached to either end without compromising their ability to bind
                                                                                                                                                                                                                                                                                                                   08-JUN-1999;
                                                                                                                                                                                                                                                                                                                                                                          08-JUN-2000; 2000WO-DE001873.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             binding protein (BBP), which can bind digoxigenin (Dig) or its conjugates, do not bind ouabain, testosterone or 4-aminofluorescein, a have an amino acid (aa) substitution at at least one of the positions 31, 34-37, 58, 60, 69, 88. 90, 95. 97, 114, 116, 125 or 127. (I), or i fusion proteins, are used to bind, detect, determine, immobilize or separate Dig or its conjugates with proteins, nucleic acids, carbohydrates, other biological or synthetic macromolecules or low molecular weight compounds, particularly in assays where Dig is being used as a libel. Compared with Dig-specific antibodies, (I) have a simpler structure and are easier to prepare. They have very high specificity for Dig, relative to other steroids, and fusion partners m be attached to either end without compromising their ability to bind
This invention describes novel polypeptides (I) that are muteins of bilin binding protein (BBP), which can bind digoxiganin (Dig) or its conjugates, do not bind ouabain, testosterone or 4-aminofluorescein, and have an amino acid (aa) substitution at at least one of the positions 28, 31, 34-37, 58, 60, 69, 88. 90, 95. 97, 114, 116, 125 or 127. (I), or its fusion proteins, are used to bind, detect, determine, immobilize or separate Dig or its conjugates with proteins, nucleic acids, carbohydrates, other biological or synthetic macromolecules or low molecular weight compounds, particularly in assays where Dig is being
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Unidentified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bilin-binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bilin binding-protein associated protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example

Compared with Dig-specific antibodies, (I) have a simpler structure and are easier to prepare. They have very high specificity for Dig, relative to other secroids, and fusion partners be attached to either end without compromising their ability to bind
                                                                                                                                                                                                                  Generating a mutein of human apolipoprotein D having detectable affinity to a given non-natural ligand of apolipoprotein D by subjecting apolipoprotein D to mutagenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ADB87310 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0
```

The present invention relates to a human apolipoprotein D (ApoD) mutein (ADB87307) having detectable affinity to a given non-natural ligand of ApoD. ApoD is a member of the lipocalin family of proteins, and is involved in serum lipid transport. Mutein ADB87307 can be used as a pharmacological drug target. The present sequence, encoded by a fragment of plasmid papoD12, is a fusion protein of ApoD, a Strep-Tag II and the

is a fusion protein ain of Protein G.

The present invention relates to a method for generating muteins of human neutrophil gelatinase-associated lipocalin (NGAL), rat alpha2-microglobulin-related protein (A2m) or mouse 24p3/uterocalin, by subjecting the protein to mutagenesis. In the method of generating a mutein, a nucleic acid coding for the muteins of the protein resulting from mutagenesis is operably fused at the 3' end with a gene coding for the coat protein pIII of a filamentous bacteriophage of the M13-family or for a fragment of the coat protein. The present sequence is the protein encoded by a fragment of plasmid pHNGAL7, used to illustrate the invention. This sequence comprises human hNGAL, a Strep-Tag II and an albumin binding domain of Protein G.
                                                                                                                                                                    Disclosure; Page 59-61; 68pp; English.

GENERAL INFORMATION:
APPLICANT: Schering AG

TITLE OF INVENTION: Device and Process for Direct Quantitative in vitro Detained of Invention: Substance That is Contained in a Sample
FILE REFERENCE: S30569US

CURRENT APPLICATION NUMBER: US/10/887,228A

CURRENT PILING DATE: 2004-07-09

PRIOR APPLICATION NUMBER: US /3 31 093.2

PRIOR APPLICATION NUMBER: US 60/478,262

PRIOR FILING DATE: 2003-07-16

NUMBER OF SEQ ID NOS: 12
